Power Quality

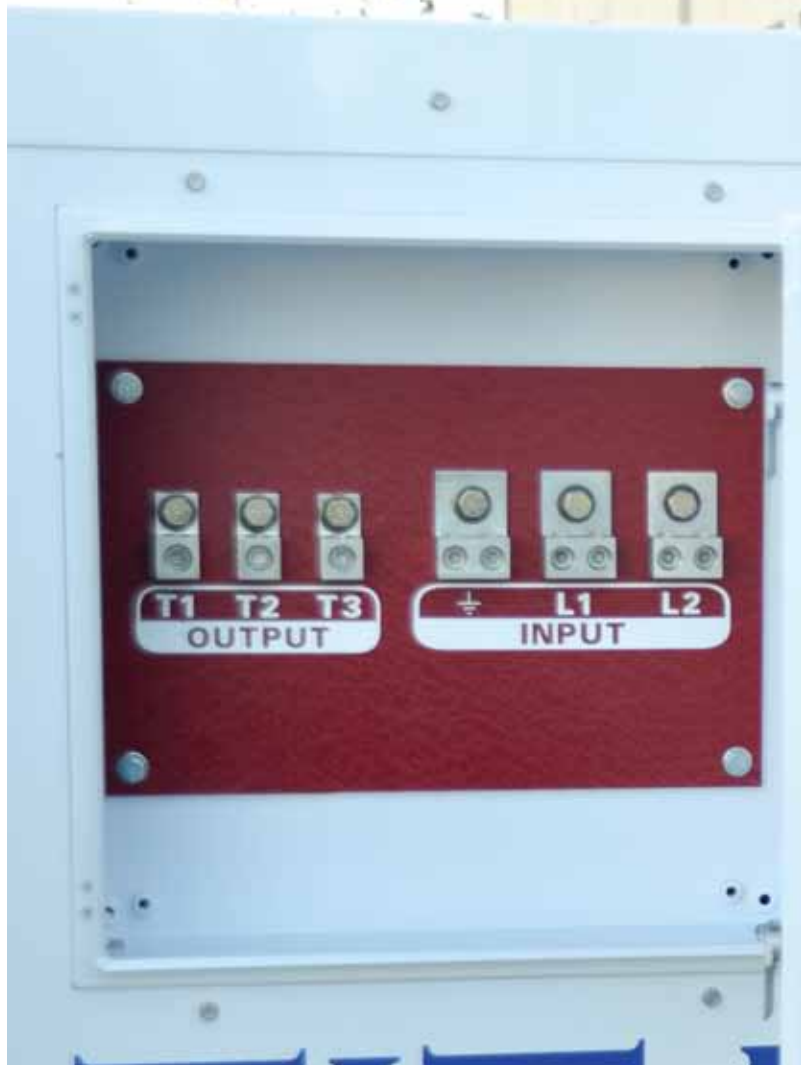

The TITAN™ line of phase conversion systems are engineered to provide stable single to three phase power. TITAN™ phase conversion systems use rotary power generation that provides the benefit of high surge capacity free of the noise and wave form distortion associated with some other phase conversion technologies.

Multi-stage to Reduce Inrush

TEMCo TITAN™ series Phase Converters utilize a multi-staged generator starting arrangement to keep startup inrush to a minimum. This soft start technology dramatically reduces stress on utility feed equipment and prevents incoming line voltage sag normally associated with starting large industrial equipment.
